

# Inline CSS

*Inline CSS in HTML refers to applying unique styles directly to a single HTML element using the style attribute within the element's opening tag. This method allows for immediate, element-specific styling without the need for external stylesheets or internal style tags.*

# Internal CSS

**Internal CSS, also known as embedded CSS, is a method of styling HTML elements by placing CSS rules directly within the head section of an HTML document. This approach allows for the styling of a single HTML page, providing unique aesthetics to that specific page without affecting other pages on a website**

# External CSS

External CSS involves placing CSS rules in a separate file with a .css extension and linking it to an HTML document. This method promotes code organization, reusability, and easier maintenance for web projects.

## Web Development Languages

No	NAME	ABOUT
1	HTML	foundational language
2	CSS	Style Sheets
3	JavaScript	dynamic language
4	PHP	server-side scripting
